To whom it may concern,

The following documentation serves as a verification of snowfall, ice, and other wintry precipitation on January 2nd, 2017. This includes accumulation and impacts as well as a storm overview summary and briefing on meteorological conditions which were present during the mentioned time frame.

This information has been verified to the best of our ability and is correct to the extent of our knowledge. Moreover, our team of forecasters have done work to verify and compare surrounding observations to confirm the validity of the snowfall total in this location.

However, snowfall amounts do vary over short distances. New York Metro Weather LLC is not responsible for any differences in measurements or errors in calculations, nor are we responsible for any assignment of wages or payment of any sort to any individual based on this snowfall report.

Sincerely,

A handwritten signature in cursive script that reads 'Doug Simonian'.

Storm Overview

A weak disturbance developing ahead of a larger storm produced light precipitation throughout New Jersey on January 2nd. Light precipitation was the predominant intensity, and temperatures throughout the atmosphere were warm enough to produce rain.

Over some locations, specifically higher elevations and interior locations, brief periods of freezing rain were observed. This was relegated mostly to North and Western New Jersey, but light freezing rain was also observed in higher elevations of Bergen County.

The freezing rain caused brief periods of slick roads and icy conditions before temperatures warmed during the afternoon and a change to plain rain occurred. The warmer temperatures allowed melting of any light ice that had developed.
